

# Lick Creek Dense Wind Slabs

Date

Sat, 12/03/2022 - 13:30

Activity

Skiing

At the saddle between the front and backside of Lick Creek we found 110cm of snow with very dense windslabs. These were firm and cohesive, with the firmest being between 100 and 90cm. Our layer of most concern was at 65cm but was difficult to impact and we felt confident our weight alone even in shallow areas would not impact this layer, we skied the front side however due to time constraints.

Region

Northern Gallatin

Location (from list)

Lick Creek

Observer Name

Ethan Jeannette
