

# Lick Creek

Date

Sun, 12/04/2022 - 00:05

Activity

Skiing

I toured in Lick Creek yesterday and thought I'd share a few things we noticed. Hopefully they are helpful observations!

While the skin track was still relatively flat and cutting through sloping meadows, we noticed a small sun crust on a southern aspect.

As we skinned through the front side skiing zone, we noticed evidence of wind affected snow. We found some strong layers that sounded hollow, sometimes underneath ~2 inches of snow. As we gained the ridgeline, the wind slab became more obvious. It cracked under my weight, but I didn't see any shooting cracks or distinct collapses.

Region

Northern Gallatin

Location (from list)

Lick Creek

Observer Name

Raini H
