Activity

Skiing

Today my partner Henry and I toured around the fields between Barronette and Warm Creek pass. Overnight snow was approximately 2" with storm total about 12". We dug a pit on an E aspect at 8,200', HS 152cm, ECTX, CT23 (RP) 50cm down on a density change. Aside from the density change that produces CT result, and 15cm of basal facets, the snow pack was right side up with no signs of instability or natural avalanche activity throughout the day. Ski quality was excellent.
