

Goose Creek Drainage

Date

Fri, 02/10/2023 - 21:30

Activity

Skiing

Did a full profile while out in Goose Creek today. Results indicated poor stability on a NE aspect about 7200 ft. The primary layer of concern was the buried surface hoar layer roughly 30 cm down in this location, took moderate strength (ECTP18) to get full propagation. Skiing conditions were good in the new snow from this weekend, you could subtly feel the MF crust from the time before the recent storm. We observed a small layer of surface hoar this morning, that will most likely be destroyed today from the intense sun on solar aspects.

Region

Northern Gallatin

Location (from list)

Goose Creek

Observer Name

Dominic Conigliaro
