

Notes: Northerly aspects have fx's. Southerly aspects have more melt freeze and less snow. NSF's on surface could be the problem with the approaching storm. I was surprised how well developed the fx's at 25-16cm were. Not like last year, but not too bad. Despite the warm weather, I think the week+ of high pressure has helped drive the faceting process with some really clear nights. We'll see what happens in the next month or so.

Advisory Region Cooke City
